INTRODUCTION

Welcome to my Power Platform Projects Portfolio. As an accomplished Power Platform Developer with extensive experience in leveraging Microsoft technologies, I am excited to showcase a collection of projects that highlight my expertise in developing innovative solutions to drive digital transformation.

With a career spanning several significant roles, including my current position as a Senior Microsoft Power Platform Engineer at REDEX in Singapore, I have spearheaded numerous initiatives to enhance data-driven decision-making. My portfolio includes projects such as the development of comprehensive management statistics dashboards using Power BI, which provide critical insights for strategic decision-making. Additionally, I have automated web data extraction processes and designed customized quotation application, demonstrating my ability to integrate and optimize various Microsoft technologies.

Each project presented in this portfolio is a testament to my commitment to innovation and excellence. Through collaboration with cross-functional teams, I have successfully gathered requirements, implemented tailored solutions, and ensured compliance with data governance and security policies. My work is characterized by a seamless integration of Power Platform tools, including Power Automate, Power BI, and Azure Synapse Analytics, to deliver robust and scalable solutions.

I invite you to explore this portfolio to gain insight into my technical skills and the impactful solutions I have delivered across different industries. Whether it's through time-series charts that depict performance trends or interactive maps and pie charts that provide a clear snapshot of current operations, my projects are designed to empower management and teams to make informed business decisions and adjust strategies effectively.

Please note that some projects in this portfolio may not include any screenshot, charts or code pieces due to NDA agreements. All projects are the property of the respective organizations, and any included images are solely for demonstration purposes.

PROJECT SUMMARIES

Central Quotation System

Description:

The Central Quotation System is a sophisticated model-driven application designed for business development and sales professionals. This application facilitates the creation of buy and sell quotations and streamlines the approval process through department heads, ensuring efficiency and accuracy in sales operations.

Tools Used:

- Model-driven App
- Power Automate
- Dataverse
- Power BI

Objectives:

- Centralize the storage of all quotations to improve accessibility and organization
- Aggregate market price data from various pricing providers for comprehensive analysis
- Analyze pricing trends and forecast future prices to aid strategic planning
- Enhance data accuracy and consistency through integrated data management
- Streamline the approval workflow to reduce bottlenecks and expedite the sales process
- Ensure secure and controlled access to sensitive data through robust security measures

Outcomes:

- Enhanced Decision-Making: Provided the business development team with comprehensive insights into pricing trends, enabling informed strategic decisions before entering new geographic markets.
- Improved Operational Efficiency: Streamlined the quotation process through automated workflows and business process flows (BPF), reducing manual effort and minimizing errors.
- Secure Data Management: Implemented robust user-based access mechanisms, ensuring secure and controlled access to sensitive quotation data.
- Increased Productivity: Enabled quick duplication of existing quotations with a one-click clone feature, accelerating the creation of new quotations and enhancing productivity.
- Real-Time Notifications: Automated notification processes for each quotation step, ensuring timely updates and improved communication among stakeholders.

- Market Intelligence: Collected and analyzed market pricing data from public domains through Power Automate, providing valuable market intelligence for pricing strategies.
- Data Integration and Synchronization: Ensured seamless data synchronization between Dataverse and Azure Synapse Analytics, maintaining data consistency and integrity across platforms.

Management BI Analytics Reports

Description:

The Management BI Analytics Reports leverage advanced Business Intelligence (BI) capabilities using Power BI to enhance decision-making and operational efficiency. These reports provide comprehensive insights into the overall performance of the organization, including various products, by utilizing diverse visualization techniques.

Tools Used:

- Power BI
- Azure Synapse Analytics
- SQL
- Python

Objectives:

- Analyze geographical performance to identify regional strengths and weaknesses.
- Evaluate market share to understand competitive positioning.
- Monitor performance trends over time for better forecasting and planning.
- Enable management and teams to make informed decisions based on real-time data.

Outcomes:

- Geographical Performance Analysis: Visualize performance across different regions using detailed map charts.
- Performance Trend Analysis: Track organizational performance over time with time series charts.
- Enhanced Decision-Making: Facilitate quicker and more informed decision-making by presenting data in an easily digestible format.
- Performance Tracking: Enable management to continuously monitor the performance of each product, ensuring prompt issue resolution.
- Strategic Planning: Support long-term planning and strategy formulation through insights derived from time series charts.
- Operational Efficiency: Improve overall efficiency and effectiveness by allowing teams to adjust working plans based on real-time data.

Solar Customer Engagement System

Description:

An end-to-end automated workflow that manages solar customer enquiries from submission to supplier assignment and feedback collection. The system integrates with SharePoint and automates document sharing, notifications, and follow-ups, ensuring a streamlined and secure customer engagement process.

Tools Used:

- SharePoint
- Power Automate
- PDF Encryption
- Outlook Email Integration

Objectives:

- Automate the customer enquiry intake and response process.
- Enable real-time supplier assignment and communication.
- Securely share customer information using encrypted PDF files.
- Standardize follow-up and feedback processes.
- Improve tracking and visibility for sales representatives.

Outcomes:

- End-to-End Automation: Reduced manual handling by automating enquiry intake, supplier assignment, and customer feedback collection.
- Improved Process Efficiency: Enabled faster response times and reduced errors in customer handling.
- Secure Data Sharing: Ensured safe transmission of sensitive customer data through encrypted emails.
- Enhanced Visibility: Sales reps gained centralized access to enquiry status and updates, improving collaboration and responsiveness.
- Business Process Improvement: Delivered a scalable and repeatable process that aligns with organizational goals of digital efficiency.

Employee Name Card System

Description:

The Employee Name Card system automates the creation of name cards for new employees, featuring a QR code generated based on the employee's information. When the QR code is scanned, a new contact form appears on mobile devices, supporting both iOS and Android platforms.

Tools Used:

- Canvas App
- SharePoint
- Power Automate
- Custom Connector
- API Integration

Objectives:

- Generate a unique QR code for each employee.
- Store all name cards in centralized storage.
- Enable easy updates when an employee's data changes.
- Ensure secure storage and access control for sensitive employee information.

Outcomes:

- Automated Name Card Creation: Employee name cards are created using the organization's template, each with a unique QR code.
- Centralized Storage: All created name cards are stored in a SharePoint folder with restricted access, limited to HR personnel.
- User-Based Access Mechanism: Implemented to ensure secure and controlled access to the name cards.
- Third-Party Integration: Utilized custom connectors to integrate with a third-party QR generator via API, enabling the generation of vCards.

Outbound Call Center Management System

Description:

The Outbound Call Center Management System replaces a manual call result recording process, which previously relied on Excel spreadsheets, with a fully automated solution. This application allows admin users to upload daily call lists and assign them to respective call officers, updating and collecting all call results in centralized SharePoint lists.

Tools Used:

- Canvas App
- SharePoint
- Power Automate

Objectives:

- Fully automate the outbound call center process.
- Enhance data accuracy and consistency in call results recording.
- Improve efficiency and productivity of call officers.
- Enable seamless admin management of call lists and call officers.
- Centralize and secure storage of call records.
- Facilitate real-time tracking and reporting of call activities.
- Implement user-based access control for data security.
- Allow easy reassignment of call officers in cases of emergency leave or other contingencies.
- Provide insights and analytics to improve call quality and customer satisfaction.

Outcomes:

- User-Based Access Mechanisms: Secure and role-based access to the system, ensuring data privacy and integrity.
- Call Types Configuration: Different call types are configured within the system to streamline call processes.
- Daily Call Lists Upload: Admins can upload daily call lists via Excel files into the system.
- Call Officer Assignment: Admins assign call officers to newly added call lists efficiently.
- User Management by Admin: Admins manage user roles and permissions within the system.
- Call Officer Reassignment: Admins can reassign call officers in cases of emergency leave or other contingencies.
- Call Records Update: Call officers can update call records directly in the system.
- Quality Checks: Team leaders and managers review call results weekly or monthly to improve call quality and performance.
- Centralized Data Storage: All call results are stored in centralized SharePoint lists, ensuring easy access and retrieval.
- Real-Time Tracking and Reporting: The system provides real-time tracking of call activities and generates comprehensive reports for performance analysis.

Sample Screen Mockup Designs:

The VS Call Officer Assignment screen has a dark blue header with the title 'VS Call Officer Assignment'. Below the header, there are three tabs: 'Summary' (selected), 'New Assignment', and 'Reassign Officer'. The main content area displays a table with the following columns: Officer Name, Officer Email, New Count, Recall Count, Followup Count, and Total Count. The table lists 20 officers and their respective counts.

Officer Name	Officer Email	New Count	Recall Count	Followup Count	Total Count
Shinn Wai Yan Bo	shinwayb@hanamicrofinance.com	0	0	0	0
Charles	charles@hanamicrofinance.com	0	0	0	0
Thandar Lwin	thandarl@hanamicrofinance.com	0	0	410	410
Poe Ei Phyu	poeephyu@hanamicrofinance.com	0	0	53	53
Ei Ei Hlaing	eielhlaing@hanamicrofinance.com	0	0	20	20
Han Mi Mi Kyaw	hanmiki@hanamicrofinance.com	0	0	28	28

The Voluntary Saving Call List screen has a dark blue header with the title 'Voluntary Saving Call List'. Below the header, there are five tabs: 'New Call List', 'On Hold List', 'Recall Call List', 'Followup Call List' (selected), and 'Success Call List'. The main content area displays a table with the following columns: Client Name, Saving ID, Branch, Phone No., Fail Remark, and Action. The table lists 18 clients and their respective details.

Client Name	Saving ID	Branch	Phone No.	Fail Remark	Action
Daw Aye Than	1405353	TBZY	9771271329	Power Off	Update
Daw Mee Sann	1328554	PALW	9699886816	wrong mobile number format	Update

Call Center Management Model-driven app

Description:

This system is an enhancement of the previous call center Canvas app. Due to the high demand and significant data volumes, which grew to tens of thousands within a few months, the Canvas app has been replaced with a model-driven app. The new app features enhanced capabilities, including integration with the 3CX phone system.

Tools Used:

- Model-driven app
- Dataverse
- Power Automate
- 3CX

Objectives:

- Improve data integrity, availability, and security.
- Enhance the call routing process using the 3CX phone system.
- Support scalability to handle increasing data volumes and user demand.
- Streamline the management of both outgoing and incoming call activities.
- Provide advanced analytics and reporting for better decision-making.

Outcomes:

- User-Based Access Mechanisms: Implement secure and role-based access control to ensure data privacy and integrity.
- Feature-Rich Model-Driven App: Retain all functionalities of the previous Canvas app with additional enhancements.
- 3CX Phone System Integration: Seamless integration with 3CX to improve call routing and management.
- Dataverse for Data Storage: Utilize Dataverse for robust and scalable data storage solutions.
- Enhanced Call Management: Efficiently manage both outgoing follow-up calls and incoming enquiries.
- Advanced Analytics: Generate detailed reports and analytics to provide insights into call center performance and customer satisfaction.
- Scalability: Handle large volumes of data and user activities efficiently to meet growing demand.
- Improved Data Integrity and Availability: Ensure reliable and secure data management practices.

Risk Zone Identification System

Description:

The Risk Zone Identification system enables the management team to receive timely updates on high-risk market areas reported by branch managers. Branch managers use the application to report high-risk villages and wards. The credit risk department then reviews these reports and updates the risk categories based on the submitted data. Subsequently, the credit risk head approves the risk categorization. This system facilitates the management team in executing necessary risk mitigation processes based on active risk zones.

Tools Used:

- Model-driven app
- Canvas app
- Dataverse
- Power Automate
- Custom Connector

Objectives:

- Provide an overview of high-risk areas in a centralized location.
- Enable easy reporting from ground-level staff.
- Consolidate and streamline the risk data collection and management process.
- Ensure real-time visibility and tracking of high-risk areas for effective decision-making.
- Facilitate seamless communication and approval workflows within the credit risk management process.

Outcomes:

- User-Based Access Mechanisms: Implement secure role-based access control to protect sensitive data and ensure only authorized personnel can view or modify information.
- Embedded Canvas Application: Integrate the Canvas app within the model-driven app to enhance user experience and reporting capabilities.
- Data Integration: Retrieve data from core banking systems and integrate it with the risk reporting system for comprehensive data analysis.
- Real-Time Report Generation: Enable real-time report generation for the management team to monitor high-risk areas and take prompt action.
- Efficient Risk Reporting: Allow branch managers to easily report the high-risk areas, ensuring timely and accurate data submission.
- Consolidated Data Management: Centralize data management to streamline the review and approval process by the credit risk department and head.
- Risk Mitigation Planning: Provide the management team with actionable insights to carry out necessary risk mitigation processes based on up-to-date risk zone information.
- Approval Workflow: Implement an approval workflow for the credit risk head to review and authorize risk categorizations, ensuring accountability and accuracy.
